

Swapping-two-values

’ AIM:

To write a python program for swapping of two values

’ EQUIPEMENT'S REQUIRED:

PC Anaconda - Python 3.7

’ ALGORITHM:

’ Step 1:

Get the two values from the user

’ Step 2:

Assign the value of second variable to a temporary variable

’ Step 3:

Assign the value of the first variable to the second variable.

’ Step 4:

Assign the value in temporary variable to the first variable

’ Step 5:

Print both the values it would be interchanged

’ Step 6:

End the program

’ PROGRAM:

```
a=int(input())
b=int(input())
a=temp
a=b
b=temp
print(a,b)
```

' OUTPUT

 Swapping values

' RESULT:

Thus the swapping of two values are successfully executed
